INSTALLATION INSTRUCTIONS （INDOOR）

1–Choosing the proper tools and implements(notched trowel, rubber mallet, suction–cups and cross–spacers for installing tiles, rubber trowel for grouting) is of the utmost importance.

2–The substrate (wall or floor) to be tiled must be perfectly level,with no defects in planarity. We recommend that damp areas be waterproofed beforehand. A difference in thickness in the adhesive layer will produce different stresses on the ceramic tile surface which will result in projecting tile edges.

3–The surface to be tiled must be completely free of dust or any other substance that could negatively affect tile adhesion. This will promote better bonding strength of the adhesive on the substrate.

4–During installation, there should be enough light to allow us to easily spot any sort of defect,especially the appearance of projecting tile edges. During this phase, work should be performed with more lighting than that which will illuminate the area once the work is finished. The use of spotlights will prove helpful in this regard.

5–Selecting the type of adhesive to use is fundamental. We must take into account the properties of the substrate to be tiled(surface of brick, wood, plaster, metal, etc.), as well as the characteristics of the chosen ceramic tiles(porous wall tiles, stoneware tiles or porcelain tiles).

6–The thin–bed installation method is recommended, with a flexible adhesive. For formats larger than 31,6×31,6(1.000cm2) the buttering–floating technique is recommended, that consists of applying the adhesive on both the substrate and the back of the tile.
7–Being as these are rectified tiles ,they require careful handing, to avoid nipped edges, chipping or scratches on the surface of tiles. The Ceramic Tile Guide* recommends that tiles not be installed with a joint width less than 1.5 mm. Between pieces.
8–For the installation of rectified materials, it is recommended that cross–spacers of at least 1 mm. be used. In rustic models the minimum joint recommended is 3 mm.. It is recommended that rectangular tiles, when arranged in a staggered layout, be installed at 3/4 th–piece intervals.

9–During installation stoppages,it should be kept in mind that the tiles already installed have contracted, and those which we are going to install will experience the same movement.Therefore,it is necessary to predict the possible movement,since if we continue tiling on the same level,the subsequent contraction may give rise to a slight difference in level.
10–It is recommended that you consider the inclusion of perimeter joints,which will help to absorb any movements after installation. These joints must be left empty,or else filled with a compressible material;the minimum recommended width for those joints is 8 mm.This joints is concealed with the skirting or with the tile itself.
11–If the substrate already has its own structural joints or dividing joints,these should be respected when ceramic tiles are installde.It must be remembered that the maximum surface area to be covered with ceramic tiles without dividing joints is 50 m² to 70 m² for interiors and half that size for exteriors.

12–During the installation phase,before setting has fully taken place,we should continuously check already installed pieces,since there is still time to fix any faults.A rubber mallet can be used to tap down projecting tiles and a suction–cup can be used to pull up pieces that are sunken in excess.

13–Before grouting,it should be made sure that installation joints (between tile and tile) are empty and free of bonding materials and traces of dirt and grime.Any intermediary substance may make installation joints less effective,in addition to hindering the adhesion of the grout.

14–Joints should be grouted once tiles are firmly bonded to the substrate.In the special case of floor tiles,the manufacturer's recommendations should be followed,so as to enable enough time to elapse before tiles are walked on or subjected to any loads.

15–The grouting material should be applied with a rubber trowel,and the use of metallic trowels should be avoided at all times,since they may damage the glazed surface of tiles.Grouts in a wide range of colours are available on the market,which make it possible to match the shade of any setting created.

16–Removing excess grouting material should be performed using a sponge dampened in water.This operation should be done in timely fashion,since if the grouting material is left in contact with the glazed surface of tiles for too long,it hinders cleaning,especially in those models the surface of which has relief.

17–It is absolutely necessary that already installed ceramic floor tiles be protected with the proper means so as to prevent possible damages until the building project is complete,due to the presence of abrasive materials and ongoing movement of tools.This will not only help to protect tiles,but it will also make subsequent cleaning easier.

18–The use of cleaning agents that contain hydrofluoric acid (HF) and solid detergents with particles that may abrade the tile surface should be avoided.Hydrofluoric acid would completely remove the glazed surface of tiles,thus causing irreparable damage.

INSTALLATION INSTRUCTIONS （OUTDOOR）

1–When installing tiles,it is extremely important that you choose suitable tools and instruments (notched trowel,rubber mallet,tile spacers,rubber trowel,and sponge for optimum results when grouting).
2–It is essential that you design and create suitable drainage slopes to avoid stagnation problems and prevent the build–up of surface water.

3–Make sure that the ground is properly waterproofed to prevent ground moisture from filtering through and to protect against the formation of bloom,moss,etc.

4–The substrate must be compact throughout in terms of thickness and surface finish,and any parts that are brittle or that could become easily detached should be removed. The substrate must also be free of dust,fat,or any other substances that could interfere with adhesion.Finally,make sure that the surface is completely even.All drainage slopes that you have previously created must be maintained when preparing the substate.

5–The installation substrate must be stable in terms of dimension and structure,and sufficient time left for drying and setting shrinkage to occur.We recommend leaving one week for each centimetre of adhesive applied.If the surface needs to be used sooner,you might consider using a quicksetting compound.

6–Correctly plan the layout of the area to be tiled in advance. When planning the layout,decide where to place perimeter and intermediate expansion joints,maintain structural joints,and do not install any tiler on these to prevent any breakage or cracking after installation.

7–In outdoor areas prone to frost,the crack must be covered well andy class C2 cement–based adhesives as per European standard EN 12004 (Adhesives for Ceramic Tiles) to install outdoor ceramic tiles.Follow the manufacturer's instructions at all times to enjoy the full benefits offered by the adhesive's properties.

8–Apply all adhesives with a notched trowel using the thin–bed method.Make sure that the size of your trowel is suited to the size of the tiles you are installing.For outdoor ro large–format tiles,always use the floating and buttering method,i.e. spread the adhesive over both the substrate and the underside of the tile.

9–Ensure that you seal tile joints properly by using a grouting mortar suited to outdoor use (Class CG2 cementbased grouting mortars as per EN 13888 – Grouting Material for Ceramic Tiles). For applications requiring greater elasticity, adhesion,and mechanical resistance,we recommend mixing your cementbased mortar with a special latex additive.

10–The correct sealing of joints is a very important part of the tiling process.Outdoor tiles should never be butted together.A joint of a least 5 mm should be left between tiles although this can be increased in areas subject to sharp temperature changes. Make sure that all joints are clean before grouting them.

At least 5mm
11–Make sure that your follow the manufacture's instructions when applying the grouting material.If you are using antislip tiles or a latex–based grout,make sure you clean away all traces of grout before it has time to dry.
12–In all cases,consider the creation of perimeter joints.These should be created at all transitions between floor tiles and vertical elements such as walls,pillars,foundation blocks,or other types of flooring.Perimeter joints should have a minimum width of 8 mm.

Minimum 8 mm
13–The width and depth of all floor structural joints must be strictly observed. Movement joints are critical to protecting ceramic tiles against damage caused by movements both normal building movements and movements caused by changes in temperature,moisture,etc.
14–When filling movement joints,do not use absorbent,closed–cell,high–compression,or temperature–resistant grouting materials.
Seal joints with a highly elastic,waterproof material that is suited to the width of the joint. This sealant must also offer sufficient mechanical and thermal resistance.

15–Intermediate expansion joints must be created in areas measuring between 9 and 25m².These joints should form a square with each side measuring no more than 5 m.A joint width of at least 8 mm should be left although this.

at least 8mm
16–Porcelain tiles should always be used in outdoor areas prone to frost (these tiles have a water–absorption rate of under 0.5%).Do not allow water to accumulate in ungrouted joints during frost periods as freezing–thawing cycles could damage the tiles.

17–You can increase safety levels in wet areas where there is a risk of slippage by choosing a tile with anti–slip properties. Bear in mind,however,that these tiles are more difficult to clean (they are more susceptible to the build–up of dirt,and dirt,in general,tends to be more difficult to remove).

Anti-slip

18–When finished tilling,make sure that you remove all traces of grout and adhesive promptly as the longer that these are in contact with the tiled surface,the more difficult they are to remove.Do not use cleaning agents containing fluorhydric acid of any other aggressive materials.

TECHNICAL SPECIFICATION

Description	Standard of test	Iso standard requirement		MAINLAND Standard
Sizes	ISO 10545.2	Length and width	±0.6%	±0.2%
		Thickness	±5%	±0.2%
		Edge curvature	±0.5%	±0.2%
		Center curvature	±0.6%	±0.2%
		Warpage	±0.5%	±0.2%
Water absorption	ISO 10545.3	E≤0.5%		0.1%
Strength	ISO 10545.4	Modulus of rupture	R≥35/MM^2	≥40/MM^2
		Breaking strength	S≥1300N	>1700N
Surface abrasion	ISO 10545.7	Breaking strength		MIN PEI3
Coefficient of linear thermal expansion	ISO 10545.8	Test method available		0.5x10°C
Resistance of thermal shock	ISO 10545.9	Test method available		Guranteed
Frost resistance	ISO 10545.12	Required		Required
Chemical resistance	ISO 10545.13	Manuf. to state		Manuf. to state
Stain resistance	ISO 10545.14	Class 3 min		Class 3 min
